

To all institutions in Finland, that are involved in the extension of the operating time of the nuclear power plant Loviisa

Ladies and Gentlemen!

As european citizens we urge you, not to agree to this project, because of the imminent danger of an accident with a huge outburst of radioactive material as in Chernobyl (SU 1986) and in Fukushima (Japan 2011) or nearly in Harrisburg (USA 1979). In several places as Forsmark in Sweden, Biblis in Germany, Cardarache in France, Tihange in Belgium and many others there were rather dangerous situations too. In each reactor the risk is growing as time goes by.

There is no safe way to store nuclear waste for millions of years!

Nuclear energy does not save the climate. All steps from uranium exploitation to waste transportation need lots of energy and produce CO<sup>2</sup>.

The money should be spent for development of a sustainable economy and renewable energies.

Chernobyl has proven that the radiation from a reactor meltdown went as far as up to Scandinavia and to western Europe!

Ecological european greetings
